
Master Uuton and Climate Change thru Helen 02.26.07

Master Uuton and Climate Change

February 26,
2007

There is a Star far away, and the Masters, or ones who connect via a Communications Center on that Star, have been contacting me. Today I send my beam to that Star, just as they send their beam out to me. Since Uuton is able to communicate with me regarding atoms and molecules, and regarding the new study I am undertaking, I will my preceptors to beam out to Uuton, to the place where he resides, if he resides at a place. If he resides in the Omnipotence, then it is easier for me to reach him, because I am allowed to visit the Heavens.

Uuton has been teaching me since 1992. He is a tall, invisible being who has never taken on a human body. He describes himself thusly, "I am truly a Master who works with the Celestial Beings. I am a Master of the Elemental Beings of the Universal Forces. That is so." He will stand behind a psychic who is asking that the information she receives be proofread or verified. This occurred to me around the year 2000 when I prepared a manuscript on the Motion of the Human Carbon Atom. Another psychic and I were proofreading the manuscript. She would read one sentence and ask if it was correct, and Uuton, Einstein and Archangel Gabriel would edit or verify it. I might add that Uuton is not what we consider a being filled with love. Uuton is a factual entity that knows Truth, that can define Truth, that is a Master of elemental changes, and that has a great respect for Creation, including humanity. That does not mean that he sympathizes with humanity, but he understands humanity as an elemental being. He is not judgmental in any way, he merely understands energy, elements, compounds, change, science, and the manipulation of matter.

I now feel that it is not necessary that I beam out to Uuton. He is here. I open my microphone, and this time I will introduce the conversation. I have read a current newspaper about global warming and about the melting of the ice cap at the Antarctic region. I consider how mankind is bemoaning the fact of the rise in temperatures, and I see the bemoaning as a fallacy. I see the ice cap melting, and the waters coming to mix in with with the Atlantic and Pacific Oceans as being a flushing, as being a cleansing. It was predicted long ago that new species will appear on earth, and the scientists have already found new species in Antarctica.

Quoting from the article: "[Scientists from 14 countries] found 1,000 species,

including a perhistoric-looking Antarctic ice fish that has no red blood cells; bright pink corals; orange sea stars with 12 arms; glass sponges; and an Antarctic octopus. They expect many are new species that have never been seen before. ' What was most striking is that there is so much left for people to discover.' To see corals at 400 to 600 metres deep that were bright pink and bright purple, it's almost unreal at that depth in really the harshest environment on the planet. Species like sea cucumbers, sea lilies and certain types of sea urchins, which had been previously found only in deep waters, were now showing up in this relatively shallow body of water. They [scientists] fear that the collapse of the two ice shelves represents the beginning of the loss of sea ice, which is vital to the sustainability of ecosystems and ocean currents." [end of excerpt].

Helen: I believe, therefore, that we should look with joy at the coming changes, and that this will assist Mother Nature. Why bemoan the fact that change is coming, if we cannot do anything about it? Why not embrace it, enjoy it. So for this reason I want to ask Uuton to tell me whatever I should tell mankind about what is occurring in the Antarctic region, and what we might expect. Also if he would please warn us about things such as moving from the coastal area and preparing agriculture for a new temperature range. All of this is what I want to ask Uuton, Master of the Elementals. Please fill the stage, my tall, handsome invisible Master. For our sake Uuton takes on the cloak of a human being in a black suit with a white tie, wearing a top hat, a cravat and gloves, and carrying a cane, as if he were an elite gentleman. This is how he prefers to appear to me today. He will appear as other types of beings from time to time.

Uuton:

Yes Madam, this is indeed a time of change. If you had been present many thousands of years ago, you would have seen a similar change, because from to time the earth the switches. The North Pole becomes the South Pole, and the South Pole becomes the North Pole, while the waters remain as they are. When you immerse a ball in water and turn the ball upside down, you do not turn the water -- the water remains. Therefore consider that it is time for change. This time the earth will not turn around as it did in other eras, therefore the change will be much more gradual, but there will be change.

If you could consider that there are two seasons in earth's evolution -- the season when it warms up, and the season when it cools down -- this is the season when earth is warming up. Mankind has hastened it somewhat, but not to the degree that is widely stated. Therefore be at peace about the changes, and approach them with joy. The climate of northern North America will become warmer, and the climate near the southern pole will become just a little bit cooler. The equator will remain reasonably the same. Therefore it should be possible for the scientists to give guidance for those living in parallel planes all around the earth. For instance, after many years, when earth warming has completed, the 49th Parallel, which divides Canada and U.S. could be considered to become the temperature of land at around the 46th Parallel. Therefore it will be to the advantage of the agriculturists in the 49th Parallel to begin to entertain plans to plant crops that will

thrive in a climate that is similar to the 46th Parallel.

The animals will be moving southward from the north, and some of the animals will be moving northward from the south. Therefore many scientist may be employed in following the changes minutely so that they can graph them over the years. The rainfall, the precipitation, the deserts will be greatly altered, and those who study that, will suddenly begin to find a pattern in the changes. The beginning of those changes will not occur for approximately four years. In other words, there will be erratic behavior in climatic conditions for another four years, and then a pattern will begin to emerge. Therefore we suggest to the scientists, to begin to record any change that is gradual, and to predict that change to move along at the same slope of the graph.

Do you have any questions?

Helen: Thank you Uuton. This is the first time that I have discussed this with anyone, and I am not very capable. However, I will ask those who know and study. I will ask them for questions and I will direct them to you, and I know how well you and Archangel Gabriel provide me with information that I can understand. I thank you for this interlude.

Uuton: Then we shall meet again. Farewell.
